

# What gives students and education system Bologna process?

## buy college essays

Despite the criticism with which the Bologna process was adopted in Russia, it is impossible to underestimate its meaningful advantages.

You can judge them, based on the tasks set, which have already been achieved in practice:

Increased image of higher education;

The emergence of students in the unique opportunity for independent choice of disciplines;

Implemented control of the quality of education;

Supposed competitiveness of universities in Europe.

So the introduction of the Bologna process did not turn out to be without a trace for domestic education, and even, on the contrary, expanded the possibilities of Russian students. Now each graduate can carry out its main life goals at the global level.

Disadvantages of the Bologna process?

Like any other innovation, the Bologna process has its shortcomings and flaws, which are also supposed to mention.

First, the bachelor for many developed countries is not a qualified specialist with completed education. Such graduates are less likely to work, and the working conditions with wages are left to desire the best. There was a stereotype that the bachelor is an unfinished higher education, that is, a student - the ability.

Secondly, the proposed Soviet model of education was broken and undermined due to the emergence of a two-level education system provided for by the Bologna process. This can be said, the historical event has a negative impact on the mentality of the entire power.

Thirdly, since the magistracy in any case is paid, many students in view of the insufficient material base have to end the highest education in the bachelor's status, which is not so prestigious.

Accordingly, the maneuver of the state is felt to reduce budget financing of the education system.

Fourthly, the receipt of international diplomas will provide "brain leakage" to the West, as a result of which Russia will decide on graduate specialists. This will suffer from many industries, in particular

the development of science.

And last: it is worth recalling that in Spain, many students and teachers impede the introduction of the Bologna system and even arrange numerous mountain rallies. In fact, it is possible to argue about this for a long time, however, in the Bologna process, there are still "truth grain", which will allow to unite the global education system and develop uniform standards for the cultivation of graduate specialists, or rather, masters and bachelors.

The main provisions of the Bologna process

1. The competitiveness of the European Higher Education system increases due to uniform samples of diplomas and successful employment in international companies.
2. Two levels of education - bachelor (3 - 4 years of study) and Master (1 - 2 years of study).
3. As the basis of the Bologna process, a single storage system ECTS, which operates under the program "Training throughout the Life" program has been taken.
4. Reducing the level of unemployment and the possibility of increasing the intellectual potential of Europe.
5. Definition of international standards of transnational education.
6. Development of new concepts of students' mobility - international.

If these items will be achieved by the Ministry of Education and to be fully observed, the Russian student will not only be internship in foreign companies in its specialty, but also rely on further employment and rainbow prospects in the career.

To date, 47 countries are attached to the Bologna process, and, observing such a positive growth dynamics, it becomes obvious that this is not the limit. The latter in 2007 was joined by Montenegro, but perhaps soon the Bologna process bursts into the education system and other powers.
